

Truss Jib

Truss Jib - Truss jib's could be utilized to pick up, transport and position trusses. The additional part is designed to work as an extended jib attachment together with a pyramid or triangular shaped frame. Usually, truss jibs are mounted on equipment like for instance a skid steer loader, a compact telehandler or a forklift utilizing a quick-coupler accessory.

Older cranes have deep triangular truss jibs which are assembled from standard open structural shapes which are fastened utilizing bolts or rivets. On these style jibs, there are few if any welds. Each bolted or riveted joint is susceptible to rust and thus requires regular maintenance and check up.

Truss jibs are designed with a back-to-back collection of lacing members separated by the width of the flange thickness of another structural member. This particular design can cause narrow separation amid the smooth surfaces of the lacings. There is limited access and little room to preserve and clean them against rust. Numerous bolts loosen and corrode in their bores and should be replaced.
